

Hello Traders

The Trend Magic is a tool for MT4 forex trading that can help you spot when a market trend might be about to change. Along with warning you about possible trend changes, the indicator can also show you the ever-changing levels of support and resistance in the market.

Beginners can really benefit from automatic trendline indicators, as they might find it tough to work out the day-to-day market trends by themselves. If you don't read the market trend right, you could enter a trade too early or too late, which could lead to losses. That's why it's key for new traders to have a tool that can accurately show them the trend signals.

Trend Magic is always keeping an eye on market momentum and produces highly likely automatic trend signals. Its knack for creating accurate trend-based buying and selling signals makes it very reliable for beginners. Plus, it can be used on multiple time frame charts and for trading all kinds of forex and stock items.

Here's how to use Trend Magic signals for your trades:

Trend Magic does not repaint its indicator and doesn't lag behind in giving you the trend signals. It uses a single dynamic trendline across the chart that shows both trend conditions and the support/resistance levels of the price.

The indicator uses two things to work out the market trend direction and the current trendline positions. It uses the Commodity Channel Index (CCI) and the Average True

Range (ATR). The CCI looks at the current price compared to its average historical price to produce buy-sell signals.

The ATR, on the other hand, is a tool that lets you measure the volatility of your trades, meaning it helps you decide the right time to enter and exit your trades. Although ATR was initially used for commodity items, it later turned out to be effective for measuring the volatility of other instruments like forex, stocks, and cryptocurrencies.

When the price moves above the Trend Magic level, it means the price is higher than its average historical price, which suggests a bullish trend. When the indicator turns blue, it's a good time to buy, because the bullish trend is reversing. If you're going long, you should keep your position until the indicator turns red.

In a bearish trend, the price will usually stay lower than the Trend Magic level. If the indicator turns red at the same time, it's a good time to sell because the market trend is bearish.

To Your Success,
Calvin Morrison
